'FHITSTR' IS NOT A VALID FORMAT FOR FILE 'CASREACT'

The following are valid formats:

ABS -------- GI and AB
ALL -------- BIB, AB, IND, RE, Single-step Reactions
APPS ------- AI, PRAI
BIB -------- AN, plus Bibliographic Data
CAN -------- List of CA abstract numbers without answer numbers
CBIB ------- AN, plus Compressed Bibliographic Data
DALL ------- ALL, delimited (end of each field identified)
IABS ------- ABS, indented with text labels
IALL ------- ALL, indented with text labels
IBIB ------- BIB, indented with text labels
IND -------- Indexing data
IPC -------- International Patent Classifications
ISTD ------- STD, indented with text labels
OBIB -------- AN, plus Bibliographic Data (original)
OIBIB ------- OBIB, indented with text labels

SBIB -------- BIB, no citations
SIBIB ------- IBIB, no citations

MAX -------- Same as ALL
PATS ------- PI, SO
SCAN ------- TI and FCRD (random display, no answer number.  SCAN
             must be entered on the same line as DISPLAY, e.g.,
             D SCAN.)
SSRX ------- Single-Step Reactions (Map, Diagram, and Summary for
             all single-step reactions)
```

```
STD -------- BIB, IPC, and NCL

CRD -------- Compact Display of All Hit Reactions
CRDREF ----- Compact Reaction Display and SO, PY for Reference
FHIT ------- Reaction Map, Diagram, and Summary for first
             hit reaction
FHITCBIB --- FHIT, AN plus CBIB
FCRD ------- First hit in Compact Reaction Display (CRD) format
FCRDREF ---- First hit in Compact Reaction Display (CRD) format with
             CA reference information (SO, PY).  (Default)
FPATH ------ PATH, plus Reaction Summary for the "long path"
FSPATH ----- SPATH, plus Reaction Summary for the "short path"
HIT -------- Reaction Map, Reaction Diagram, and Reaction
             Summary for all hit reactions and fields containing
             hit terms
OCC -------- All hit fields and the number of occurrences of the
             hit terms in each field.  Includes total number of
             HIT, PATH, SPATH reactions. Labels reactions that have
             incomplete verifications.
PATH ------- Reaction Map and Reaction Diagram for the "long
             path".  Displays all hit reactions, except those
             whose steps are totally included within another hit
             reaction which is displayed
RX --------- Hit Reactions (Map, Diagram, Summary for all hit reactions)
RXG -------- Hit Reaction Graphics (Map and Diagram for all hit reactions)
RXL -------- Hit Reaction Long (Map, Diagram, Summary for all hit reactions)
RXS -------- Hit Reaction Summariers (Map and Summary for all hit reactions)
SPATH ------ Reaction Map and Reaction Diagram for the "short
             path".  Displays all single step reactions which
             contain a hit substance.  Also displays those
             multistep reactions that have a hit substance in both
             the first and last steps of the reaction, except for
             those hit reactions whose steps are totally included
             within another hit reaction which is displayed

To display a particular field or fields, enter the display field
codes.  For a list of the display field codes, enter HELP DFIELDS
at an arrow prompt (=>).  Examples of combinations include: D TI;
D BIB RX; D TI, AU, FCRD.  The information is displayed in the same order
as the specification.  All of the formats, except CRD, CRDREF, FHIT, PATH,
FPATH, SPATH, FSPATH, FCRD, FCRDREF, HIT, RX, RXG, RXS, SCAN, and OCC, may
be used with the DISPLAY command to display the record for a specified
Accession Number.

ENTER DISPLAY FORMAT (FCRDREF):ibib

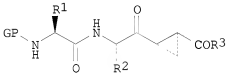
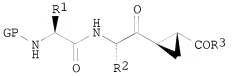
GI



I



II

AB The invention relates to substantially pure diastereoisomeric dipeptide epoxides of formulas I and II, where GP is a protective group, R1 is phenylmethyl, 4-hydroxyphenylmethyl, (1H-indol-3-yl)methyl, or (1H-imidazol-4-yl)methyl; R2 is H, Me, CH2SH, CH2OH, CH2Ph, CH2CO2H, CH2CONH2, CHMeOH, CHMeEt, CHMe2, CH2CHMe2, (CH2)2SMe, (CH2)2CO2H, CH2CONH2, (CH2)3NHC(:NH)NH2, (CH2)4NH2, imidazol-4-ylmethyl, 4-hydroxyphenylmethyl, (1H-indol-3-yl)methyl, (1H-imidazol-4-il)methyl, or (CH2)nAr (n is 2 or 3; Ar is a carbon or nitrogen radical of a known

carbocyclic aromatic ring which optionally has 1-3 heteroatoms N, S or O and may be substituted), and R3 is alkyl, alk(en)(yn)oxy, -O-alkyl-Ar, -OAr, NRa-Ar, NRa(alkyl-Ar), or NRaO-Ar, or NRa-alkoxy-Ar or their pharmaceutically-acceptable salts. These compds. are inhibitors of cruzain, rhodesain and falcipain cysteine proteases and are therefore used for the treatment and/or prevention of pathologies such as Chagas's disease, African trypanosomiasis or malaria. Thus, I and II [GP = benzyloxycarbonyl (Cbz), R1 = benzyl, R2 = phenethyl, R3 = ethoxy] were prepared by a multistep sequence involving reactions of 4-phenylbutyric acid, (E)-Et 3-formylacrylate, and Cbz-protected L-phenylalanine. Products I and II were evaluated for inhibition of Tripanosoma brucei brucei (Tbb), cruzain, rhodesain, and cathepsin B (percent inhibitions are 42 and -2%, 93 and 55%, 98 and 80%, and 51 and 47%, resp.).

DOCUMENT TYPE: Journal
LANGUAGE: English

AB The novel complex RuCl2[(S)-Xyl-P-Phos][(S)-DAIPEN] was identified as a highly active catalyst for the asym. reduction of a variety of prochiral ketones possessing an imidazo[1,2-a]pyridine scaffold. The corresponding alcs. were obtained in excellent enantiomeric purities (>96% ee) and served as valuable intermediates for the synthesis of pharmacol. active 7H-8,9-dihydropyrano[2,3-c]imidazo[1,2-a]pyridines. The complexity of these multi-functional substrates required the development of specific reaction conditions. Whereas the reduction with RuCl2[PP][NN] catalysts (Noyori catalysts) has never been reported to occur under aqueous conditions, in the presence case, the use of aqueous isopropanol or tert-butanol was not only tolerated, but also turned out to be beneficial, especially when the reduction
was conducted at high substrate to catalyst (S/C) ratios.

I II III

AB The olivomycins are representative antitumor antibiotics in the aureolic family of the compds. which contain the tricyclic aglycon core, olivin. In this study, an efficient synthesis of the anthracenone core skeleton was established based on a cycloaddn. reaction between the homophthalic anhydride I and the chiral cyclohexenone derivative II, which was promoted by the combined use of mol. sieves, proton sponge, and a Lewis acid. The cyclohexenone with four chiral centers was synthesized by asym. and diastereoselective reactions, and was subjected to the cycloaddn. reaction with a homophthalic anhydride followed by a sequence of reactions to accomplish stereoselective synthesis of (+)-2-deoxyolivin (III).

AB In contrast to five-membered E-ring analogs, 7-oxyiminomethyl derivs. of homocamptothecins showed ability to form stable ternary complexes with DNA and topoisomerase I. The 7-oxyiminomethyl derivs. of homocamptothecins were evaluated as a racemic mixture Following the isolation of the two enantiomers, the 20 (R)-hydroxy isomer I confirms the best activity. By using a panel of human tumor cells, all tested homocamptothecins showed a potent antiproliferative activity, correlating to the persistence of the cleavable complex. No significant difference was observed between the natural scaffold and the corresponding homocamptothecin homolog. A selected compound of this series exhibited an excellent antitumor activity against human gastrointestinal tumor xenografts.

AB Further optimization of the potent antifungal activity of side chain analogs of the natural product FR901379 led to the discovery of compound (I) with an excellent, well-balanced profile. Potent compds. with reduced hemolytic potential were designed based upon a disruption of the linearity of the terphenyl lipophilic side chain. The optimized compound I (FK463, micafungin) displayed the best balance and was selected as the clin. candidate.

AB This invention pertains to a process for the preparation of duloxetine and intermediates thereof. For example, 2-acetylthiophene was condensed with N-methylhydroxylamine hydrochloride and paraformaldehyde in ethanol under nitrogen in presence of 36% hydrochloric acid under reflux to give an intermediate, which was reduced with sodium borohydride and then treated with zinc in glacial acetic acid and water at 50 °C to afford N-methyl-γ-hydroxy-2-thiophenepropanamine ethanedioate (1:1). The ethanedioate salt obtained above was treated with sodium hydride in a mixture of DMSO and THF under nitrogen atmospheric, and then reacted with 1-fluoronaphthalene at 60 °C for 44 h to afford duloxetine as ethanedioate salt. Process for the preparation of optically pure duloxetine was also disclosed in the invention.

AB A method for the synthesis of duloxetine hydrochloride [i.e., (γS)-N-methyl-γ-(1-naphthalenyloxy)-2-thiophenepropanamine] is reported here. Duloxetine hydrochloride was synthesized via a sequence involving a Mannich reaction, reduction, separation, etherification, demethylation and salt formation using 2-acetylthiophene as reactant. The chemical structure of duloxetine hydrochloride was confirmed by elemental anal., UV, IR, 1HNMR, 13CNMR and ESI-MS etc. This process can be easily controlled and is suitable for a larger-scale manufacture of duloxetine hydrochloride.

AB An asym. total synthesis of (+)-cis-sylvaticin [I, X = (CH2)7, Y = (CH2)9] is described. Key steps include the use of permanganate-mediated oxidative cyclization of 1,5-dienes to synthesize the two major fragments II and III and a catalytically efficient tethered RCM to unite these THF-containing fragments. In addition, tert-BuP4 base was found to reliably promote rapid alkylation of the butenolide precursor fragment IV.

I

AB As the largest secondary metabolite to be discovered as of yet, the polyether marine neurotoxin maitotoxin constitutes a major structural and synthetic challenge. After its originally proposed structure had been questioned on the basis of biosynthetic considerations, we provided computational and exptl. support for the structure. In an effort to provide stronger exptl. evidence of the mol. architecture of maitotoxin, its GHIJKLMNO ring system I was synthesized. The 13C NMR chemical shifts of synthetic I matched closely those corresponding to the same domain of the natural product providing strong evidence for the correctness of the originally proposed structure of maitotoxin.

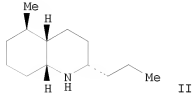
I



II

AB The use of an exhaustive hydrogenation strategy in the total syntheses of bicyclic alkaloids was established. The two examples presented included the total synthesis of (+)-swainsonine (I) and pumiliotoxin C (II). A common theme in these syntheses involves deprotection of key functional groups under hydrogenation leading to the formation of iminium ion, which was then further reduced under the reaction condition to the annulation products. In order for this strategy to work successfully, several aspects must be taken into consideration. First, a proper choice of protective groups and their timely deprotection under a single condition, thus unmasking the reactive functionalities, must be planned carefully. In the swainsonine case, exposure to hydrogenation converted azide to amine and benzyl ether to hemiacetal, and this yielded an unprecedented aminoaldehyde adduct through rearrangement in a one-step process, whereas with pumiliotoxin C, hydrogenation saturated two olefins and removed a protecting group, thus leading to a reactive aminoketone intermediate. Second, the deprotection conditions must not hinder the reactivity of newly exposed functionality. In the swainsonine case, intramol. condensation between the secondary amine and the aldehyde to the corresponding iminium ion readily occurred. However, in pumiliotoxin C, such a reaction appeared to be slow, and an introduction of HCl was necessary for efficient cyclization. Finally, stereoselective reduction of the resulting iminium ion may be achieved if the conformation of such an intermediate allows facial differentiation.

AB Sialylation reactions using a new sialyl donor, di-Et 5-acetamido-4,7,8,9-tetra-O-acetyl-3,5-dideoxy-2-O-β-D-glycero-D-galacto-2-nonulopyranosylonamide phosphite (Neu5Ac-1-amide-2-phosphite) derivs., and the synthesis of the sialyl-TN-MUC4 glycopeptide are described. The sialylation was performed in CH2Cl2 solvent toward the 6-hydroxyl group of several monosugar acceptors and generated α-sialoside in good yield under low temperature and TMSOTf activation system. Amide derivs. of sialoside were easily converted into naturally occurring sialoside after hydrolysis of the amide group. Sialyl-α(2,6)-GalN3 was also prepared by this new sialylation protocol, and then this sialoside was further converted into a Fmoc-protected sialyl-TN serine derivative (I) (Fmoc = 9-fluorenylmethyloxycarbonyl) for solid-phase glycopeptides synthesis. The solid-phase glycopeptide synthesis using this sialyl-TN serine derivative I in which the sugar hydroxyl group was free afforded the target sialyl-TN-MUC4 glycopeptide.

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB The reaction of salicylaldehyde with 1-chloro-3-mesitylacetone and potassium carbonate was used to prepare 1-(1-benzofuran-2-yl)-2-mesitylethanone (I) for the starting reagent purposes. 1-(1-Benzofuran-2-yl)-2-mesitylethanoneoxime (II) was synthesized by the reaction of the compound I with hydroxylamine. New semicarbazone derivative of compound I was obtained in very high yields. Alkyl substituted N-oxime ethers were obtained by the substitution reaction of compound II and various alkyl halides. Acyl substituted N-oxime ethers, e.g., III, were synthesized by the acylation of the compound II with acyl chlorides. Some of the synthesized compds. were tested for antimicrobial activity against Staphylococcus aureus ATCC 6538, Escherichia coli ATCC 25922 and Candida albicans ATCC 10231. Among the synthesized compds., III was found the most active derivative against S. aureus ATCC 6538 and E. coli ATCC 25922. The other compds. exhibited moderate activity against the other test microorganisms.

AB A formal convergent synthesis of solamin is disclosed. The synthetic strategy exploits the potential of the sulfinyl group as an auxiliary, nucleophile, and in C-C bond formation. The synthetic route can be adapted to the synthesis of stereoisomers of solamin, analogs with variable carbon side chains, and other members of mono-THF acetogenins.

IV

AB A simple strategy has been developed for the synthesis of both enantiomers of epi-nor-canadensolide (I, II), nor-canadensolide (III, IV), and an intermediate to canadensolide. An orthoester Claisen rearrangement of an appropriately constructed allyl alc. derivative prepared from R-(+)-2,3-di-O-cyclohexylidine glyceraldehyde followed by epoxidn. of the resulting unsatd. esters produced hydroxy-lactones, which on oxidation gave keto-lactones. Stereoselective reduction of the keto-carbonyl using either a chelation controlled or a non-chelation controlled process led to the natural or the epi-series, resp. The interplay of the electronic effect between the polar groups and the steric effect of the β-substituent during reduction of the keto-lactones turned out to be the key factors in deciding the stereochem. outcome. Regeneration of the aldehyde functionality latent in the ketal moiety of the hydroxy-lactones provided the lactols, which on oxidation gave the bis-lactones.

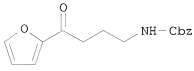
I



II

AB An enantioselective and diastereocontrolled approach to 8a-epi-D-swainsonine (I) has been developed from achiral furfural. The key step to this synthesis was a one-pot procedure for the hydrogenolytic removal of two protecting groups and two intramol. reductive amination reactions. The absolute stereochem. was introduced by asym. Noyori reduction of furfuryl ketone II. This route relies on diastereoselective palladium-catalyzed glycosylation to install the anomeric bond, and Luche reduction, diastereoselective dihydroxylation to set up the manno-stereochem. of the indolizidine precursor.

I

AB The total synthesis of fully functionalized polyhydroxyamide B,C-seco-analogs of the anticancer compound pancratistatin (PST) is reported. Key steps include an Evans' MgCl2-promoted anti-aldol reaction between a functionalized L-threose derivative and (R)-(+)-oxazolidinone to stereoselectively form the C-1/C-10b bond and a regiospecific radical-mediated oxidative fragmentation of a 1,3-benzylidene. The B,C-seco compds. I (R12 = CMe2; R1 = H) exhibited low activity (ED50 > 30 μg/mL) for inducing apoptosis in human cancer cells.

I

AB A short and efficient synthesis of the antitumor diterpenoid (+)-zerumin B (I) has been accomplished starting from (+)-sclareolide. At the heart of the synthetic strategy lies the regioselective formation of the α-substituted γ-hydroxybutenolide moiety of zerumin B. This was achieved by means of a [1,4] O→C triisopropylsilyl migration followed by singlet oxygen (1O2) oxidation of the resulting 2-triisopropylsilyl-3-(α-hydroxy)alkylfuran.

AB Cholesterol absorption inhibition (CAI) represents an important treatment option for hypercholesterolemia. Herein, we report the design and evaluation of a series of substituted oxazolidinones as ligands for the Niemann Pick C1 Like 1 (NPC1L1) protein, a key mediator of cholesterol transport. Novel analogs were initially evaluated in a brush border membrane NPC1L1 binding assay; subsequently, promising compds. were evaluated in vivo for acute inhibition of cholesterol absorption. These studies identified analogs with low micromolar NPC1L1 binding affinity and acute in vivo efficacy of >50% absorption inhibition at 3 mg/kg.

AB The aryl hydrocarbon receptor (AhR) is a ligand-activated transcription factor that mediates most of the toxic effects of numerous chlorinated (e.g., TCDD) and nonchlorinated polycyclic aromatic compds. (e.g., benzo[a]pyrene). Studies in AhR null mice suggested that this receptor may also play a role in the modulation of immune responses. Recently, two drugs, namely, M50354 and M50367 (Et ester derivative of M50354), were described as AhR ligands with high efficacy toward reducing atopic allergic symptoms in an AhR-dependent manner by skewing T helper cell differentiation toward a TH1 phenotype. Surprisingly, these drugs were shown to have minimal activity toward inducing classical dioxin responsive element-driven AhR-mediated CYP1A1 transcription. We synthesized and reevaluated the ability of these drugs to regulate AhR activity. In contrast to previously published data, both M50354 and M50367 were found to be potent inducers of several AhR target genes, namely, CYP1A1, CYP1B1, and UGT1A2. M50367 was a more effective agonist than M50354, perhaps accounting for its higher bioavailability in vivo. However, M50354 was capable of displacing an AhR-specific radioligand more effectively than M50367. This is consistent with M50354 being the active metabolite of M50367. In conclusion, two selective inhibitors of TH2 differentiation are full AhR agonists.

AB The magnesium chloride catalyzed anti-aldol reaction of aryl acetate-derived oxazolidinones proceeds readily with enolizable L-threose derivative to provide anti-aldol adducts in high yields and with very high diastereoselectivities. The reaction is also efficient with aromatic aldehydes and provides slightly lower diastereoselectivities. This extension allows access to stereochem. defined fragments applicable to the synthesis of alkaloid and phenylpropanoid derivs.

AB 3-Alkynyl-1,2-alkanediols such as I (R = Me, Bu, Ph, MeO2C; R1 = Bu, Ph) undergo regioselective 5-endo-dig iodocyclisation reactions to yield iodofurans such as II (R = Me, Bu, Ph, MeO2C; R1 = Bu, Ph). Alkynyldiols are prepared by stereoselective dihydroxylation of enynes (no data) or by addition of alkynyllithium reagents (generated in situ from terminal alkynes) to protected or unprotected α-hydroxy ketones or esters. Using this method, 3-iodo-2,4,5-tri(2-furanyl)furan is prepared; attempted Suzuki coupling with 2-furanboronic acid yields only 2,3,5-tri(2-furanyl)furan rather than the desired 2,3,4,5-tetrakis(2-furanyl)furan.

AB A highly enantioselective and stereocontrolled approach to D-, L- and 8-epi-D-swainsonine, I, II and III, resp., was developed starting from achiral furan and γ-butyrolactone. A one-pot hydrogenolysis of both azide and benzyl ether followed by an intramol. reductive amination was employed as key step to establish the indolizidine ring system. The absolute stereochem. was installed by the Noyori reduction and the relative stereochem. by the use of several highly diastereoselective palladium-catalyzed glycosylation, Luche reduction, dihydroxylation, and palladium-catalyzed azide allylation reactions. This practical approach provide multigram quantities of indolizidine natural product D-swainsonine in 13 steps and 25% overall yield.

AB Claimed is a pharmaceutically acceptable salt of duloxetine having enantiomeric purity of 98% or more. Also claimed is a process for preparing duloxetine having enantiomeric purity of 98% or more by reacting (1S)-3-(dimethylamino)-1-(2-thienyl)propan-1-ol (I) with 1-fluoronaphthalene (II), followed by dealkylation of the product and isolation of duloxetine or its salt. Thus, reaction of I with II in DMSO, followed by reaction of the product with Ph chloroformate in chloroform containing diisopropylethylamine and treatment of the demethylated product with KOH in refluxing toluene, gave, after workup, duloxetine as an oily mass which was then treated with maleic acid to give duloxetine maleate (enantiomeric purity : 99.98%).

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB The synthesis of dioxadiazuliporphyrinogen I and its oxidized forms: dioxadiazuliporphyrin II and dication II2+, is reported. These compds. were characterized in solution using UV-vis and 1H and 13C NMR spectroscopic means and in the solid state via single-crystal X-ray diffraction anal. Dioxadiazuliporphyrin is a nonarom. porphyrinoid, readily and reversibly oxidizable to its cation radical and to the aromatic carbaporphyrinoid dication, which can be viewed as a 21,23-dicarba-22,24-dioxaporphyrin with two fused tropylium rings. Further insight into the geometric and magnetic manifestations of aromaticity and antiaromaticity in the case of the redox couple II, II2+ is obtained using d. functional calcns. and nucleus-independent chemical shifts.

AB 7H-8,9-Dihydropyrano[2,3-c]imidazo[1,2-a]pyridines I (R1 = Ph, 2-MeC6H4, 2-FC6H4, 4-FC6H4, 2-thienyl; R2 = Me, HOCH2, Me2NCO, Et, Me2NCH2, MeCO, Br, MeC.tplbond.CCO, etc.; R3 = Me2NCO, H2NCO, MeSO2NHCO, HO2C, etc.) with excellent physicochem. and pharmacol. properties were identified that represent interesting candidates for further development as potassium-competitive acid blockers (P-CABs). The title compds. were prepared following synthetic pathways that relied either on a Claisen rearrangement/cross-metathesis reaction or on the (asym.) reduction of prochiral ketones. The influence of the character of the substituents on the biol. activity and the physicochem. properties of the target compds. was examined In contrast to the parent system (R3 = H), compds. in which R3 represents a carboxamide residue generally show improved in vivo activity and favorable pKa/log D values. Whereas variation of R2 is useful to obtain target compds. with modified basicity and lipophilicity, strong inhibition of the H+/K+-ATPase and potent in vivo activity is observed for R2 = Me only. Small modifications of the R1 aryl group, e.g., replacement of hydrogen vs. a fluoro atom or a Me group, are allowed. The (9S)-enantiomers are responsible for the gastric acid secretion inhibiting action, whereas the (9R)-enantiomers are virtually inactive.

AB The invention relates to a process for the synthesis of compds. of the formula I and II. The compds. of the formula I and II are valuable intermediates for the preparation of pharmaceutically active compds. A process for preparing compds. of formula I and II was R1 and R2 are independently H, C1-4 alkyl, C3-7 cycloalkyl, C3-7 cycloalkyl-C1-4 alkyl, etc.; R3 is H, amino, C1-4 (fluoro)alkyl, C2-4 alkyl, C2-4 alkynyl, etc.; Arom is (un)substituted (mono/bi)cyclic aromatic ring; is claimed. Compds. of formula I and II were prepared by asym. catalytic hydrogenation of the corresponding ketone using a chiral ruthenium catalyst. Example compound III was prepared by ruthenium-catalyzed asym. catalytic hydrogenation of 3-[6-(3,3-difluoroazetidin-1-ylcarbonyl)-8-hydroxy-2,3-dimethylimidazo[1,2-a]pyridin-7-yl]-1-(2-methylphenyl)propan-1-one; the resulting chiral (R)-alc. underwent cyclization to give compound II. These compds. may be useful in the treatment of gastrointestinal disorders.

AB Title compds. represented by the formula I [wherein m = 0 or 1; L1, L2 = independently -alkyl-, -CH2-alkenyl-, -CH2-alkynyl-, etc.; R1, R2 = H, (cyclo)alkyl, aryl, etc.; n = 0 or 1; and pharmaceutically acceptable salts thereof] were prepared as serotonin transport inhibitors and/or modulators of 5HT1A. For example, II was provided in a multi-step synthesis starting from the reaction of allylglycine Me ester with 2,4-dimethoxybenzaldehyde. I were tested for radioligand binding to the human 5-HT1A receptor and to human 5-HTT, and for [35S]GTPγS binding of 5-HT1A receptor activation and inhibition. Thus, I and their

pharmaceutical compns. are useful for the treatment of depression and related disorders.

AB The stereoselective synthesis of tetrasubstituted tetrahydrofurans and trisubstituted tetrahydropyrans bearing a sulfoxide moiety was achieved by reductive cyclization (Et3SiH/TMSOTf) of the corresponding enantiopure hydroxy ketones protected as dioxolanes. The latter are easily accessible from a Reformatsky-type reaction between α-bromo-α'-sulfinyl ketones and protected α- or β-ketoaldehydes, followed by diastereoselective reduction of the resulting β-ketosulfoxide.

AB Stereoselective total synthesis of biol. active styryllactones 7-epi-goniofufurone, goniofufurone, goniopypyrone, goniotriol, altholactone, and etharvensin was achieved in high overall yields from a common intermediate derived from D-(-)-tartaric acid. It is based on the utility of a masked tetrol, comprising an alkene tether and four contiguous hydroxy groups. The pivotal reaction sequence involves hydroxy-directed lactonization via the oxidation of alkene, and subsequent elaboration to styryllactones. The masked tetrol was prepared by the extension of γ-phenyl-γ-hydroxy butyramide, readily obtained from the bis-dimethylamide of tartaric acid, employing a combination of selective Grignard addns. and a stereoselective reduction

AB A process for the preparation of (+)-duloxetine or an acid addition salt thereof
comprises resolving (±)-N-Me duloxetine with a less than stoichiometric amount of a chiral acid in combination with suitable amts. of a hydrohalic acid to give a salt of the chiral acid and (+)-N-Me duloxetine substantially free from (-)-N-Me duloxetine, and demethylation of the (+)-N-Me duloxetine. Thus, (±)-N-Me duloxetine oxalate (preparation given) was free-based and treated with D-tartaric acid in EtO H to give 30% (+)-N-Me duloxetine D-tartrate. The latter was free-based and treated with Ph chloroformate and diisopropylethylamine in PhMe to give 55% (+)-duloxetine as the oxalate.

AB A highly efficient protocol for the large-scale oxidative cyclization of 1,5-dienes is described. This convenient ruthenium(VIII)-catalyzed (0.2 mol%) cyclization reaction allowed the preparation of cis-2,5-disubstituted tetrahydrofurans, e.g., I, in high yields (up to 92%) and excellent diastereomeric ratio (>95:5 dr). This simple and reliable method is insensitive to moisture and air and can, therefore, be carried out in an open reaction vessel.
